## Price-quantity Interactions in Business Cycles

1976

the paper provides an explicit mixed strategy equilibrium solution for an oligopoly game in the specification of the model it is assumed that each firm has to make a decision on the production level while it names its prices and a fixed unit cost for unsold inventory is introduced hence both price and quantity appear as strategic variables author

## Duopoly with Price and Quantity as Strategic Variables

1970

industrial price quantity and productivity indices the micro economic theory and an application gives a comprehensive account of the micro economic foundations of industrial price quantity and productivity indices the various results available from the literature have been brought together into a consistent framework based upon modern duality theory this integration also made it possible to generalize several of these results thus this book will be an important resource for theoretically as well as empirically oriented researchers who seek to analyse economic problems with the help of index numbers although this book s emphasis is on micro economic theory it is also intended as a practical guide a full chapter is therefore devoted to an empirical application three different approaches are pursued a straightforward empirical approach a non parametric estimation approach and a parametric estimation approach as well as illustrating some of the more important concepts explored in this book and showing to what extent different computational approaches lead to different outcomes for the same measures this chapter also makes a powerful case for the use of enterprise micro data in economic research

## Aggregative Measures of Price and Quantity Change in Commodity Markets

1987

this book is the first comprehensive text on index number theory since irving fisher s 1922 the making of index numbers the book covers intertemporal and interspatial comparisons ratio and difference type measures discrete and continuous time environments and upper and lower level indices guided by economic insights this book develops the instrumental or axiomatic approach

the author relates u s export and import trends over the past four decades to changes in the domestic economy and in the trade of other countries originally published in 1963 the princeton legacy library uses the latest print on demand technology to again make available previously out of print books from the distinguished backlist of princeton university press these editions preserve the original texts of these important books while presenting them in durable paperback and hardcover editions the goal of the princeton legacy library is to vastly increase access to the rich scholarly heritage found in the thousands of books published by princeton university press since its founding in 1905

## Price-mediated Trade with Quantity Signals

a sizable amount of research has been devoted to foreign trade price determination and the pass through from exchange rate to import and export prices following the large fluctuations of the u s dollar in the mid 1980s most of the studies have been concerned with large economies like us germany and japan and often these

studies do not pay attention to the time series properties of the data this study addresses these two important gaps in the literature focuses on the pricing behavior of exporters and importers in small open economy and applies the i 2 cointegrated vector autoregressive model that allows the data to speak freely in particular this line of research is relevant for european countries given the large movements in nominal and real exchange rates associated with the currency crisis of the early 1990s the introduction of the euro in 1999 and the current crisis facing the union

it is by now well known that the presence of small lump sum costs of adjusting prices can lead to nominal price rigidity however the argument of adjustment costs could equally well be applied to quantities thereby leading to rigid quantities this paper examines the importance of adjustment costs on both prices and quantities in a dynamic monopoly model where the firm has to decide whether it uses price or quantity or both as the adjustment mechanism to shocks which can be permanent or temporary it is shown that there is more downward rigidity than upward and that this asymmetry is enhanced when the quantity adjustment costs consist of linear adjustment costs on top of the lump sum furthermore prices seem to bear a relatively larger proportion of the adjustment burden when the shock is large and vice versa for quantities when the shock is small finally the firm may be rationed even when adjustment is carried out

the international movement to convert the real deflated components of the nipas to chain indexes in order to assure timeliness has introduced grave inconsistencies most importantly the components no longer add up to the totals the u s accounts which employ a fisher chain have additional inconsistencies for example the product of the price and quantity indexes does not reproduce the change in nominal expenditure the paper presents a unified approach to the construction of price and quantity measures which can be chained while maintaining every kind of consistency the solution is based on a combination of elements from the theories of price indexes and consumer surplus

we combine publicly available data from freddie mac the decennial census of housing and the bureau of economic analysis to construct the first constant quality aggregate price index for the stock of residential land in the united states we uncover five main results a since 1970 residential land prices have grown faster but b have also been twice as volatile as existing home prices c averaged from 1970 to 2003 the nominal stock of residential land under 1 4 unit structures accounts for 38 of the market value of the housing stock and is equal to 50 of nominal annual gdp d the real stock of residential land under 1 4 unit structures has increased an average of 0 6 per year since 1970 and e residential investment leads the price of residential land by three quarters we also estimate that in 2003 q3 the nominal value of the entire stock of residential land is the same as annual gdp finally we show for the us data that the logarithms of the nominal price index for residential land disposable income and interest rates are cointegrated abstract

pokharel and liang 2012 a model to evaluate acquisition price and quantity of used products for

equilibrium price and quantity  
worksheet answers

remanufacturing international journal of production economics 138 170 176 considered a consolidation center that buys used products of different quality levels and sells them together with spare parts to a remanufacturer the consolidation center's decision problem is to determine the acquisition price to offer for used products and the quantities of spare parts to buy in this paper comments on their work are given it is shown that following pokharel and liang's original assumptions the problem has a trivial solution we then consider an alternative assumption where supply is uniform and depends on the acquisition price for this setting an efficient solution algorithm and numerical examples are provided in a second model additional assumptions are relaxed allowing the consolidation center more flexibility as expected this further decreases cost

what are supply and demand in the present essay the notion of supply and demand in the market traditional to economics is exposed to critical rethinking from the point of view of uncertainty and probability concept the stationary probability price space model is developed for the description of behavior of a seller and a buyer in the price space of a one good market in an economy being in a normal stationary state within the framework of the model the terms supply and demand have changed their meaning a new definition of the seller's supply and the buyer's demand functions is given these functions are probabilistic in nature and they are normalized to their total supply and demand expressed in monetary units in other words they are seller's and buyer's probability distributions making a purchase sale transaction in the market for a certain sum of money respectively further with the help of the proposed additivity and multiplicativity formulas for supply and demand the stationary probability price space model is extended to economies having many goods and many agents in the price space by this strategy the probabilistic supply and demand functions of the whole market are constructed as a main result of the work we have laid the groundwork for probability economics it is defined as a new quantitative method for description analysis and investigation of the model as well as real economies and markets this article is addressed to those interested in the background of economics first of all in axiomatic basis of modern economic theory

## **Price-quantity Adjustment in a Keynesian Economy**

1998

we consider the endogenous choice of strategic variable price or quantity in a duopoly market for differentiated goods in the presence of network externalities we show that if the rival goods are substitutes in demand but the degree of network compatibility is large enough to outweigh the substitution effects each firm chooses price as its strategic variable this finding is a rare exception to the usual result that if the goods are substitutes each firm would choose quantity as its strategic variable moreover we show that two non standard results hold when the above condition is satisfied and the efficiency difference between the two firms is large first the price of the less efficient firm is higher under price competition than under quantity competition second in a situation where one firm sets quantity and the other firm sets price the profit of the more efficient firm is higher when it is the quantity setter than when it is the price setter and the opposite is true for the less efficient firm
