original essays by leading scholars consider the environment from biological and ethical perspectives philosophical reflections on the environment began with early philosophers invocation of a cosmology that mixed natural and supernatural phenomena today the central philosophical problem posed by the environment involves not what it can teach us about ourselves and our place in the cosmic order but rather how we can understand its workings in order to make better decisions about our own conduct regarding it the resulting inquiry spans different areas of contemporary philosophy

many of which are represented by the fifteen original essays in this volume the contributors first consider conceptual problems generated by rapid advances in biology and ecology examining such topics as ecological communities adaptation and scientific consensus the contributors then turn to epistemic and axiological issues first considering philosophical aspects of environmental decision making and then assessing particular environmental policies largely relating to climate change including reparations remediation and nuclear power from a normative perspective contributors katie mcshane robert brandon rachel bryant michael trestman brian stevenson denis walsh lorraine code jay odenbaugh joseph cannon mariam thalos chrisoula andreou clare palmer ben hale kristin shrader frechette andrew light

the irrigated area in the aral sea basin totals about 7 5 million hectare part of the water supplied to this area is consumed by the irrigated crop the remainder of the supplied water drains to the groundwater basin to downstream depressions or back to the rivers during its use however this drained part of the water accumulates salts and chemicals the disposal of this polluted water causes a variety of environmental problems if the percentage consumed water of the total water supply to an irrigated area the so called overall consumed ratio can be increased less water needs to be drained this alleviates part of the related environmental problems further if the overall consumed ratio for the above 7 5 million hectare is improved less water needs to be diverted from the rivers hence more water can flow towards the aral sea as mentioned above part of the non consumed irrigation water drains to

the groundwater basin commonly the natural discharge capacity of this basin is insufficient to handle this imported water as a result the groundwater table rises towards the land surface causing waterlogging in semi arid zones this waterlogging triggers a soil salinity problem resulting to a significant reduction in crop yields the artificial increase of the discharge capacity and lowering of the groundwater table solves the soil salinity problem

This book demonstrates that there is much about the New Deal that can be characterized as environmental. Once one substitutes the word "environmental" for "conservation," indeed, the scholarship that is contained within this extraordinary book will help correct the widely held view that the New Deal is virtually a blank space in the history of modern environmentalism. In fact, the New Deal carried forward and greatly extended the work of the progressive conservation era and in many ways helped establish the foundation for the modern environmental movement.

Plastics offer a variety of environmental benefits; however, their production, applications, and disposal present many environmental concerns. *Plastics and the Environment* provides state-of-the-art technical and research information on the complex relationship between the plastic and polymer industry and the environment, focusing on the sustainability, environmental impact, and cost-benefit tradeoffs associated with different technologies. Bringing together the field's leading researchers, Anthony Andrady's innovative collection not only covers how plastics affect the environment but also how environmental factors affect plastics. The relative benefits of recycling, resource recovery, and energy recovery are also discussed in detail. The first of the book's four sections represents a basic introduction to the key subject matter of plastics and the environment. The second explores several pertinent applications of plastics with environmental implications: packaging, paints and coatings, textiles, and agricultural film. The third section discusses the behavior of plastics in some of the environments in which they are typically used, such as outdoors, in biotic environments, or in fires. The final section consists of chapters on recycling and thermal treatment of plastics waste. Chapters include commodity polymers, plastics in transportation, biodegradation of common polymers, thermal treatment of polymer waste, and incineration of plastics. The contributors also focus on the effectiveness of recent technologies in mitigating environmental impacts, particularly those for managing plastics in the solid waste stream. Plastic and design engineers, polymer chemists, material scientists, and ecologists will find *Plastics and the Environment* to be a vital resource to this critical industry.

reversed pesticide policy leading to a ban on ddt for agricultural use this compelling volume offers an in depth analysis of the life works and importance of rachel carson critical essays focus on how the book put human impact at the center of environmental policy how some felt that carson exaggerated her claims and how environmentalism stands in the way of human progress the book also offers readers contemporary perspectives on environmental disasters
