excerpt from journal of the new york botanical garden 1919 vol 20 the volume published dedicated to one of the finest of colombia s scholars and statesmen michael a caro after a brief geological introduction divides into three portions the first part the therapeutic flora runs over the vegetation of the country for the dicotyledons family by family listing the best known and especially the medicinal species and making for each some entry of locality and of medicinal use often the latter entries are quite full and while i am little qualified to judge i should suppose that this is a mine of valuable observations the monocotyledons and higher cryptogams are not so fully entered although he has much to say of these an industrial flora follows on pages 132 to 151 similar in treatment but much briefer to me in my travels in remote sections of the country the most valuable portion of the book is the third the index of the common names of the plants used in colombia this embraces pages 153 to 275 and is much more than an index each entry contains the scientific name of the species and very generally notes of occurrence and uses in a country where physicians and medicines are rare and few the people pay that close attention to the flora which must have characterized the english in the times when our wealth of english names came into being and so it is but natural to find almost every colombiano well versed in plant names to a novice cortes index was indeed a key to the more important part of the flora about the publisher forgotten books publishes hundreds of thousands of rare and classic books find more at forgottenbooks com this book is a reproduction of an important historical work forgotten books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy in rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition we do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works

## **A Dictionary of American Plant Names (Classic Reprint)**

2018-03-08

excerpt from a dictionary of american plant names the book naturally divides into two parts the first consisting of the vernacular names arranged under their proper genus and species and the second a cross referenced index to the first list the genera in each family and the species in each genus are arranged alphabetically but in an endeavor to indicate the best known vernacular name as well as to distinguish those that are obsolete or misapplied it was found impracticable to arrange the names under each species alphabetically the plan has been to print the most commonly used name in small capitals while the others in ordinary type follow somewhat the order of their importance in the rare cases in which a given plant is recognized by a different name in different parts of its range both names are printed in small capitals it has often been a matter of nice distinction to decide which of two names is more commonly used here the author has been obliged to rely on his own judgment he has often followed the usage of botanical manuals but often also he has used names which in his experience appear to have a wider circulation in any case the next name that might be regarded as entitled to first place follows immediately after the other so that both will be found together obsolete names are set off from the others by a dash and those regarded as misapplied are placed in parenthesis about the publisher forgotten books publishes hundreds of thousands of rare and classic

excerpt from botanical names for english readers many names that we consider english are simply latin or greek as angelica crocus asparagus sometimes the terminations are slightly altered as in agrimony agrimonia saxifrage saxifraga gentian gentiana others are translations of continental names as devil s bit morsus diaboli hound s tongue cynoglossum loose strife lysi machia we might suppose however when we meet with a name like jack of the buttery sedum acre that such a one at any rate is english but this is not always the case for dr prior who is our best authority on these matters tells us of this absurd appellation in his popular names of british plants that it seems to be a corruption of bot theriacque to buttery j eds the plant having been used as a theriac or anthelmintic about the publisher forgotten books publishes hundreds of thousands of rare and classic books find more at forgottenbooks com this book is a reproduction of an important historical work forgotten books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy in rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition we do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works

excerpt from the small mammals of colorado this bulletin on the small mammals of colorado omits all mention of the tree squirrels ground squirrels chipmunks and gophers which were excellently treated by mr robert rockwell in his bulletin on those animals the present paper aims to give some mention of our smaller mammals though it has been a little difficult at times to tell where to draw the line and what to include and what to omit many of these animals are but little known to the casual observer largely because of the nocturnal habits of the majority of the species and the retiring habits of others when one becomes acquainted with them and their ways he finds them very interesting and their life histories well worth studying in fact there is still much to be learned about many of them since the writers the mammals of colorado was published some ten years ago a number of the genera of north american mammals have been studied by specialists with the result that some species and subspecies have been added to and others dropped from our local list and

some of the scientific names have been changed while not making the latter especially prominent in the text they have invariably been given for they are a more positive identification of the species than any english or vernacular names no detailed descriptions of any of the species are included only a general idea of the color and size is given the total length is from the end of the nose to the end of the tail measured in a straight line when the animal is stretched out and the tail is measured from the root to the tip i have omitted all mention of the bats although a considerable number of species is found in the state these belong to so many different genera that a general description of the animals would be very unsatisfactory and a detailed account is somewhat beyond the scope of this paper for interesting and authoritative accounts of the habits of many of our small mammals i would refer my readers to the wild animals of north america by e w nelson chief of the u s biological survey published by the national geographic society mr nelson s opportunities of observing the habits of many of our species have been remarkable and he has made much use of the work of other naturalists in giving scientific names when the name of a genus is repeated it is not given in full but abbreviated to the initial letter likewise in the case of repetition of specific names unless otherwise mentioned the illustrations are from my own photographs nos 1 2 3 4 6 7 8 10 11 13 14 15 16 18 and 20 were originally published in the mammals of colorado and are printed from the cuts used in that book for several of the illustrations which have not hitherto been published i wish to acknowledge my indebtedness to mr charles mace mr clark blickensderfer mr albert haanstad and the colorado agricultural college through mr w l burnett the pictures will doubtless be of as much use as the text in showing what the animals are like about the publisher forgotten books publishes hundreds of thousands of rare and classic books find more at forgottenbooks com this book is a reproduction of an important historical work forgotten books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy in rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition we do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works

excerpt from science readers for silent reading vol 6 early men of science n ancient times people knew very little about the sun moon and stars they thought the gods in some manner managed them and when one of them disappeared from view in an eclipse the people were filled with fear however in desert countries like egypt and babylonia where there are never any clouds to shut off the view men of science gradually found out a surprising number of truths about the stars the desert people discovered five stars that moved about in the sky while all the others that they could see seemed to be stationary these five moving stars they called planets which means wanderers they are mercury venus mars jupiter and saturn our earth is also one of these wanderers and now we know there are still others which the ancient men could not see the people of those days did not know what made these planets move nor did they know the paths they move in we now know that the giant sun holds them from running away into space by the force of gravity and that these five children of the sun including the earth and a few others revolve around him in regular paths they are the sun's family and are called the solar system what men of those days needed most was a better eye with which to observe the stars without aid the human eye can see about five thousand stars only but with a great telescope we can see hundreds of millions of them at about the time when john smith and his colony were landing at jamestown a dutch spectacle maker named lippershey found that if you look through two lenses placed at some distance apart you can see far away objects much better for they are magnified or made to appear larger a single lens makes what we call a magnifying glass nobody had tried two lenses together before as soon as galileo the astronomer of italy heard of this discovery he thought it would help him to see the stars better so he made an instrument not much bigger than a toy spyglass which he called a looking tube this was the best eye that had ever been turned toward the stars about the publisher forgotten books publishes hundreds of thousands of rare and classic books find more at forgottenbooks.com this book is a reproduction of an important historical work forgotten books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy in rare cases an imperfection
