fourteen question answering systems which are more or less completely programmed and operating are described and reviewed the systems range from a conversation machine to programs which make sentences about pictures and systems which translate from english into logical calculi systems are classified as data based text based and inferential principals and methods of operations are detailed and discussed it is concluded that the data base question answerer has passed from initial research into the developmental phase the most difficult and important research questions for the advancement of general purpose language processors are seen to be concerned with measuring meaning dealing with ambiguities translating into formal languages and searching large tree structures author

The Process of Question Answering

1977

problems in computational question answering assume a new perspective when question answering is viewed as a problem in natural language processing a theory of question answering has been proposed which relies on ideas in conceptual information processing and theories of human memory organization this theory of question answering has been implemented in a computer program qualm currently being used by two story understanding systems to complete a natural language processing system which reads stories and answers questions about what was read the processes in qualm are divided into 4 phases 1 conceptual categorization which guides subsequent processing by dictating which specific inference mechanisms and memory retrieval strategies should be invoked in the course of answering a question 2 inferential analysis which is responsible for understanding what the questioner really meant when a question should not be taken literally 3 content specification which determines how much of an answer should be returned in terms of detail and elaborations and 4 retrieval heuristics which do the actual digging to extract an answer from memory
